

Creating a flat design game can be an exciting journey filled with both positives and negatives. Being involved in such a project allowed me to reflect on various aspects that contributed to the overall experience. In this reflection, I delve into the positive and negative aspects that emerged during the development of our level design game.

****Positive:****

1. ****Even distribution of work:**** One of the most important positive aspects of our level design game project was the effective distribution of work between team members. We identified each member's strengths and divided tasks accordingly. This ensured that everyone felt valued and contributed meaningfully to the project. Assigning tasks to people according to their abilities not only increases the quality of work, but also increases the sense of satisfaction of team members.
2. ****Flow of Ideas:**** Throughout the project we experienced a significant amount of creative ideas. Brainstorming was effective and we were able to come up with innovative concepts for our game levels. This creative synergy within the team was refreshing and led to the development of an engaging and dynamic gaming experience. This reinforced the idea that collaboration can be a powerful catalyst for creativity.
3. ****Effective execution of ideas:**** While generating ideas is important, executing them successfully is equally important. Fortunately, our team was able to effectively translate our creative concepts into the game. It showed not only our technical skills but also our ability to work together towards a common goal. Bringing the ideas to life in the game was definitely a rewarding experience.
4. ****Company:**** Another positive aspect of our project was the friendship that developed between the team members. As we spent countless hours working together, we developed strong bonds and learned to trust each other. This friendship created a positive working atmosphere and made cooperation more pleasant. It was clear that a supportive and friendly team atmosphere can significantly increase productivity and morale.

****Negatives:****

1. ****Lack of Element Implementation:**** One notable negative aspect of our level design game was the lack of implementation of key game elements such as potions and other items. Although we had creative ideas for these elements, they were not featured prominently in the game. This missed opportunity affected the overall depth and complexity of our game. In retrospect, we should have focused more on integrating these elements to improve the player's experience.
2. ****Communication breakdowns:**** Despite our generally positive teamwork, there were communication breakdowns in the group. This was expressed as misunderstandings and disagreements in the direction of the project. Clear and effective communication is critical in any collaboration, and these interruptions served as a reminder of the importance of maintaining open lines of communication throughout the project.
3. ****Lack of Game Testing:**** Game testing is a critical step in game development to identify and fix issues and improvements. Unfortunately, retesting was rarely done in our project due to the increased development time. As a result, we lost opportunities to gather valuable feedback and improve our game. Project completion delays hindered our ability to make timely changes based on player experience.

In conclusion, creating a flat design game can be a rewarding and challenging endeavor. After positive reflection, we realized that the equal distribution of work, the free flow of creative ideas, the effective implementation of those ideas and the camaraderie between

team members greatly enriched our project experience. These aspects contributed to our personal growth and the overall quality of our game. However, we also encountered negative things that were valuable learning experiences. Inadequate implementation of objectives, communication breaks and lack of playtesting highlighted areas where we could be improved. These challenges underscored the importance of planning, effective communication, and meeting project timelines.

In the end, our level design game project was a journey full of ups and downs, but it gave us valuable insights into the world of game development. Going forward, we will apply these lessons to our future endeavors and strive to create even more engaging and complex games.
